

Living in East Asian neighborhoods may help protect against obesity and diabetes, while South Asian communities may face higher risks for heart and metabolic conditions.

Ethnic Enclaves, Mental Health, and Cardiometabolic Risk in Asian Americans
<p>Eun Young Choi, PhD¹ and Virginia W. Chang, MD, PhD^{2,3}</p> <p>¹ Leonard Davis School of Gerontology, University of Southern California ² School of Global Public Health ³ Grossman School of Medicine, New York University Email: choieuny@usc.edu & vc43@nyu.edu</p>
Background
<p>Many subgroups within the Asian American (AA) community face higher rates of poor mental health and cardiometabolic (CMB) risk, but the drivers of these disparities remain unclear. Very little is known about how Asian enclaves may shape AA mental and CMB health, with prior work largely aggregating AAs homogenously, obscuring important variation among subgroups with different countries of origin and language profiles.</p>
Objective
<p>This project will be the first to examine the role of <u>disaggregated ethnicity-specific enclaves</u> for AA’s mental health and CMB risk.</p> <p>Aim 1. Identify differences in health status by ethnic subgroups Aim 2. Characterize ethnic-specific Asian enclaves Aim 3. Examine how ethnic-specific Asian enclaves are associated with health outcomes</p>
Methods
<p>Data/Sample: 2015-2020 New York City Community Health Survey (NYCCHS) linked to 2015-2019 American Community Survey (ACS) 5-year estimates. Sample includes AA ages 18+, 51% female (N=6,810)</p> <p>Measures Asian groups: East Asian (Chinese, Korean, Japanese), South Asian (Indian), Southeast Asian (Filipino, Vietnamese) Poor mental health: Depressive disorders (PHQ-8 ≥5) and psychological distress (K6 ≥5) CMB risk outcomes: Obesity using BMI (kg/m2) values ≥30; Self-reported lifetime hypertension and diabetes Ethnic enclaves: % of residents per PUMAs for each Asian group, with the top quintile indicating an ethnic enclave, subject to minimum thresholds (16% for East Asians, 10% for South Asians) Covariates: Age, sex, nativity, Asian ethnic subgroup membership, marital/partner status, education, income, health insurance Analysis: Logistic regression models for each health outcome, adjusting the standard errors for PUMA clustering</p>

Findings

Differences in AA Mental and Cardiometabolic Health by Ethnicity

Health Outcome	Non-Hispanic White	East Asian	South Asian	Southeast Asian
Poor mental health	30%	25%	35%	42%
Obesity	19%	6%	16%	11%
Diabetes	7%	9%	22%	8%
Hypertension	22%	20%	30%	26%

Up to 54% of AAs Live in Asian Enclaves

Enclave Type	East Asian	South Asian	Southeast Asian
East Asian Enclaves	54%	15%	40%
South Asian Enclaves	10%	45%	14%

Minimum Geographic Overlap between Ethnic-specific Asian Enclaves

Enclave Type

- East & South Asian Enclave
- East Asian Enclave
- South Asian Enclave
- Not Enclave

Flushing, Murray Hill & Whitestone
MOST EAST ASIANS (46%)
South Asian (4%) Southeast Asian (2%)

Sunnyside & Woodside
MOST DIVERSE ASIANS
East Asians (17%) South Asians (12%) Southeast Asian (7%)

Howard Beach & Ozone Park
LARGEST SOUTH ASIANS (22%)
East Asian (2%) Southeast Asian (1%)

East Asian Enclaves Protective Against Obesity and Diabetes; South Asian Enclaves Increased Risk for All CMB Outcomes

Health Outcome	East Asian Enclaves	South Asian Enclaves
Poor mental health	0.80+	1.41*
Obesity	0.68*	1.35*
Hypertension	0.80+	1.44*
Diabetes	0.80+	1.41*

Odd ratios from logistic regression models, adjusting for covariates. * $p < .05$; + $p < .10$.

Discussion

- Our findings **challenge the conventional view** that Asian enclaves are monolithically beneficial for health and redirects scholarly attention toward **disaggregated approaches** to investigating and uncovering AA health disparities.
- As a next step, we will also incorporate **neighborhood-level measures** such as economic factors and built and food environment measures to explore **explanatory pathways**.
